

# Find all the answers in your data.

## Gain a deeper understanding of your enterprise hybrid cloud backup with Predatar Analytics.

With hybrid and multi-cloud environments now commonplace for businesses, data infrastructures have become chaotically complex. Enterprises are wrangling with both legacy systems and modern cloud-based workloads. Data is stored on-premise, on virtual machines and in containers. Unfortunately, many organisations lack clear and complete visibility of their backups across the complex storage ecosystems they run, and the efficacy of recovery processes is often unknown. When it comes to managing and protecting this data, it's tricky to know where to begin.

## Dig into the detail.

You can't control your data estate if you can't oversee it. With Predatar's Analytics tool, you'll gain visibility and know everything there is to know about your data.

**Simple,  
user-friendly  
dashboard**

**Insightful and  
in-depth reporting**

**Proactive  
alerting**

Drawing insights from the entire history of your backups, Predatar shares valuable information with the relevant members of your team, via a simple, user-friendly dashboard. Predatar reports on every element of your backup environment, alerting you when a backup's been unsuccessful, identifying trends within your data, and sharing insights to help you resolve and prevent issues.

**PREDATAR**

# How it works

## Use your data to your advantage.

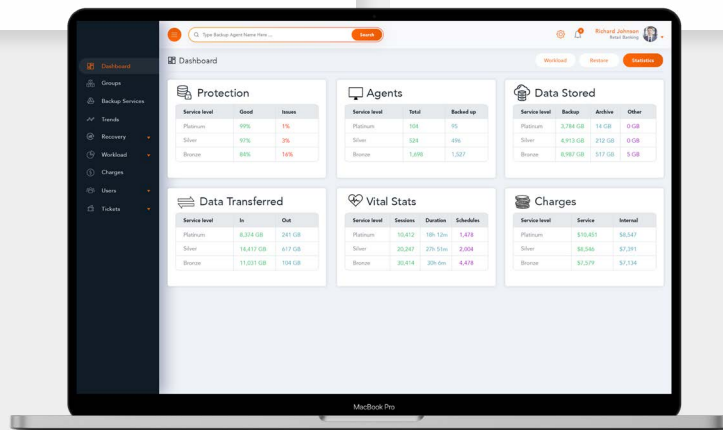

From installations of Spectrum Protect and Spectrum Protect Plus, Predatar can gather comprehensive data about your estate. By analysing this data over time, you'll uncover long-term trends and be able to make well-informed decisions about your future backup strategy. You can also review your usage, spot areas of growth, and identify cold data. This can then be tiered to the cloud and save you money on storage costs.

## Unlock insightful reporting.

The user-friendly web portal hosts a suite of reports and gives even the non-technical members of the team a detailed look at what's going on in your data environment, at any given time. Spot data storage spikes, oversee data transfers, and monitor charges. From recoverability states to dedupe ratios, you'll have all the need-to-know information, at your fingertips.

If you want regular snapshot updates, daily reports can be set up to land in your inbox. You'll be first to know when backups fail, and be able to fix them faster.

Predatar Analytics gives you all the knowledge you need to stay in control of your data and make well-informed decisions about your enterprise backup environment.
